CCR Deadline to MSDH & Customers by July 1, 2018!

2018 JUN 28 PM 1: 46

2017 Annual Drinking Water Quality Report Matthews Moss Water Association PWS#: 340008 June 2018

We're pleased to present to you this year's Annual Quality Water Report. This report is designed to inform you about the quality water and services we deliver to you every day. Our constant goal is to provide you with a safe and dependable supply of drinking water. We want you to understand the efforts we make to continually improve the water treatment process and protect our water resources. We are committed to providing you with information because informed customers are our best allies. Our water source is from wells drawing from the Miocene Aquifer.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The wells for the Matthews Moss Water Association have received moderate rankings in terms of susceptibility to contamination.

If you have any questions about this report or concerning your water utility, please contact Tommy Harrison at 601.422.5664. We want our valued customers to be informed about their water utility. If you want to learn more, please join us at any of our regularly scheduled meetings. They are held on the first Monday of the month at 6:00 PM at the Matthews-Moss Water Association.

We routinely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st to December 31st, 2017. In cases where monitoring wasn't required in 2017, the table reflects the most recent results. As water travels over the surface of land or underground, it dissolves naturally occurring minerals and, in some cases, radioactive materials and can pick up substances or contaminants from the presence of animals or from human activity; microbial contaminants, such as viruses and bacteria, that may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; inorganic contaminants, such as salts and metals, which can be naturally occurring or result from urban storm-water runoff, industrial, or domestic wastewater discharges, oil and gas production, mining, or farming; pesticides and herbicides, which may come from a variety of sources such as agriculture, urban storm-water runoff, and residential uses; organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations and septic systems; radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining activities. In order to ensure that tap water is safe to drink, EPA prescribes regulations that limit the amount of certain contaminants in water provided by public water systems. All drinking water, including bottled drinking water, may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health risk.

In this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions:

Action Level - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow

Maximum Contaminant Level (MCL) - The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) - The "Goal" (MCLG) is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Residual Disinfectant Level (MRDL) – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary to control microbial contaminants.

Maximum Residual Disinfectant Level Goal (MRDLG) – The level of a drinking water disinfectant below which there is no known or expected risk of health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or a single penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter - one part per billion corresponds to one minute in 2,000 years, or a single penny in \$10,000,000.

TEST RESULTS										
Contaminant Violation Date Level Range of Detects or Unit MCLC Y/N Collected Detected # of Samples Measure Exceeding -ment MCL/ACL/MRDL								Likely Source of Contamination		
Inorganic Contaminants										
10. Barium	N	2015*	.0866	No Range	ppm	2	2	Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits		

13. Chromium	N	2015*	.8	No Range	ppb		100	100	Discharge from steel and pulp mills; erosion of natural deposits
14. Copper	N	2015/17	ो	0	ppm		1.3	AL=1.3	Corrosion of household plumbing systems; erosion of natural deposits; leaching from wood preservatives
17. Lead	N	2015/17	0	0	ppb		0	AL=15	5 Corrosion of household plumbing systems, erosion of natural deposits
Disinfection By-Products									
Chlorine	N	2017	1.1	.7 – 1.28	ppm	0	MR		Water additive used to control microbes

^{*} Most recent sample. No sample required for 2017.

As you can see by the table, our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected however the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements, MSDH now notifies systems of any missing samples prior to the end of the compliance period.

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Our water system is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601,576.7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline 1.800.426.4791.

The Matthews Moss Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protect our water sources, which are the heart of our community, our way of life and our children's future.

Please note this CCR will not be mailed out to each individual customer. It will be printed in local paper and a copy can be obtained at our office.

* see attached This report is designed to present to you thin year's Annual Quality Water Report. This report is designed to inform you about the quality water and inces we deliver to you exervise. Our constant goal is to provide you with a rafe and dependable supply of drinking water. We want you to contain the efforts we make to continuelly improve the water treatment process and protect our water resources. We are committed to continuelly improve the water treatment process and protect our water resources. We are committed to continue you with information because informed customers are our best allies. Our water source is from wells drawing from the Miccene tourse.

The source water assessment has been completed for our public water system to determine the overall susceptibility of its drinking water supply to identify potential sources of contamination. A report containing detailed information on how the susceptibility determinations were made has been furnished to our public water system and is available for viewing upon request. The webs for the Matthews Moss Water Association have received moderate rankings in terms of susceptibility to contamination.

If you have any questions about this report or concerning your water utility, please contact Tommy Harrison at 601 422 5664. We want our valued customers to be informed about their water utility. If you want to learn more, please join its at any of our regularly scheduled meetings. They are held on the first Monday of the month at 6.00 PM at the Matthews Moss Water Association.

We routhoely monitor for contaminants in your drinking water according to Federal and State laws. This table below lists all of the drinking water contaminants that were detected during the period of January 1st December 31st, 2017. In cases where monitoring wasn't required in 2017, the table reflects the most recent results. As water travels over the surface of land of undergound, it dissolves naturally occurring minerals and the sonie class of reduced in 2017, and it is presented an amount of an arrange of sonie class of reduced in 2017, and it is presented an arrange of sonie class of an arrange of sonie contaminants and an arrange of sonie class of an arrange of sonie contaminants and water operations and water water descharges of and gas product or mining or ferming pessiones and herbicides which may come runoff moustrial or domestic waterwater descharges of and gas product or industrial processes and petroleum production and can also come from gas synthetic and potation of the contaminants. Including the processes and petroleum production and can also come from gas synthetic and potation of the contaminants. The arrange of the result of oil and gas production and manning stations and sonie systems and contaminants. The can be naturally occurring or be the result of oil and gas production and manning stations and sonie systems and contaminants. The contaminants in water noted by public water systems All dinguity water including bottled directing valer may be reasonably expected to contain at least small provided by public water systems. All dinguity water including bottled directing valer may be reasonably expected to contain at least small amounts of some contaminants. It's important to remember that the presence of these contaminants does not necessarily indicate that the water poses a health rise.

m

to this table you will find many terms and abbreviations you might not be familiar with. To help you better understand these terms we've provided the following definitions.

Across Level - the concentration of a contaminant which it exceeded inggers treatment or other requirements which a water system must

Maximum Contaminant Level (MCL). The "Maximum Allowed" (MCL) is the highest level of a contaminant that is allowed in drinking water MCLs are set as close to the MCLGs as feasible using the best minutable treatment technology.

Maximum: Contaminant Level Goal (MCLG). The "Goal (MCLG) is the level of a contaminant in idinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety

Maximum Residual Disinfectant Level (MRDL) — The bighest level of a disinfectant allowed in drinking water. There is continuing endence that addition of a disinfectant is necessary to control microsisis contaminants.

Maximum Residual Distrifectant Level Goal (MRDCG) - The level of a drinking water distrifectant below which there is no known or expected risk of health. MRDCGs do not reflect the benefits of the use of distributions to control microbial contaminants.

Parts per million (ppin) or Milligrams per Mer (mg/l) - one part per million corresponds to one minute in two years of a single penny in \$10,000

Parts per bellon (pob) or Micrograms per hier - one part per billion corresponds to one minute in 2,000 years or a single penty in \$10 (\$0,000).

Most recent sample. No sample required for 2017.

As you can see by the table our system had no violations. We're proud that your drinking water meets or exceeds all Federal and State requirements. We have learned through our monitoring and testing that some constituents have been detected nowever the EPA has determined that your water IS SAFE at these levels.

We are required to monitor your drinking water for specific constituents on a monthly basis. Results of regular monitoring are an indicator of whether or not our drinking water meets health standards. In an effort to ensure systems complete all monitoring requirements. MSOH now notifies systems of any missing samples prior to the end of the compliance needs.

If present elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in dnnking water is primarily from materials and components associated with service linus and home plumbing. Our water system is responsible for providing high quality dnnking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for direking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in direking water, testing methods, and steps you can take to minimize exposure is available from the Safe Direking. Water Hotine or at http://www.epa.gov/safewater/lead. The Mississippi State Department of Health Public Health Laboratory offers lead testing. Please contact 601 576 7582 if you wish to have your water tested.

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or man made. These substances can be microbas, inorganic or organic chemicals and radioactive substances. All orniking water including bottles water may reasonably be expected to contaminate small amounts of some contaminants. The presence of contaminates does not necessarily indicate that the water poses a health tisk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's Sale Drinking Water Hottine at 1-800-426-4791.

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno compromised persons such as persons with cencer undergoing chemotherapy, persons who have undergone organ transplants, people with PEYALDS or other animose persons with cencer undergoing chemotherapy, persons who have undergone organ transplants, people with PEYALDS or other animose system disorders, some elderly, and infants can be personally at risk from infections. These people should seek notice about drinking water statements from their health care provides. EPACDC guidelines on appropriate means to lessen the risk of infection by Cryptospondium and other from their health care provides. EPACDC guidelines on appropriate means to lessen the risk of infection by Cryptospondium and other microbial contaminants are available from the Safe Diriking Water Hothoy 1 800 426-4791.

The Matthews Moss Water Association works around the clock to provide top quality water to every tap. We ask that all our customers help us protection water sources, which are the heart of our community, our way of life and our children's future.

Please note this CCR will not be mailed out to each individual customin. It will be printed in local paper and a copy day be obtained at our
